# CrossWorks Mass Storage Library

The *CrossWorks Mass Storage Library* is a collection of functions and device drivers that add mass storage capability to your application. We have primarily designed the Mass Storage Library to work well on reduced-memory real-time embedded systems that require mass storage, but you can equally well use the library on faster processors with more memory.

The Mass Storage Library is designed to run exclusively in the CrossWorks tasking environment; if your application doesn't use tasking and you wish to use this product then you must convert your application to run in a tasking environment which is simple enough to do. If you are using some other real time operating system, then using the Mass Storage Library is not viable and should seek a product that integrates well with your existing RTOS—or ditch that RTOS and use our excellent CTL tasking environment instead.

As you would expect, the Mass Storage Library integrates with other components in the CrossWorks Target Library. For instance, the Mass Storage Library uses the CrossWorks Device Library to provide physical-layer I/O to devices. The Mass Storage Library both integrates with the CrossWorks Streams framework.

## **Object Code Evaluation License**

If you are evaluating the Mass Storage Library for use in your product, the following terms apply.

#### **General terms**

The source files and object code files in this package are not public domain and are not open source. They represent a substantial investment undertaken by Rowley Associates to assist CrossWorks customers in developing solutions using well-written, tested code.

#### **Library Evaluation License**

Rowley Associates grants you a license to the Object Code provided in this package solely to evaluate the performance and suitability of this library for inclusion into your products. You are prohibited from extracting, disassembling, and reverse engineering the Object Code in this package.

## **Object Code Commercial License**

If you have paid to use the Mass Storage Library in your product, the following terms apply.

#### **General terms**

The source files and object code files in this package are not public domain and are not open source. They represent a substantial investment undertaken by Rowley Associates to assist CrossWorks customers in developing solutions using well-written, tested code.

### **Object Code Commercial License**

If you hold a paid-for Object Code Commercial License for this product, you are free to incorporate the object code in your own products without royalties and without additional license fees. This Library is licensed to you PER DEVELOPER and is associated with a CrossWorks Product Key which, when combined, forms the entitlement to use this library. You must not provide the library to other developers to link against: each developer that links with this Library requires their own individual license.

ctl_ms_write_block       Write a fixed-size block to a file         ctl_ms_write_string       Write a string to a file         Folder functions       Ctl_ms_change_current_folder         Change the working folder	ctl_ms_read_string	Read a string from a file			
ctl_ms_write_string  Write a string to a file  Folder functions  ctl_ms_change_current_folder  Change the working folder	ctl_ms_set_attributes	Set the attributes of a file			
Folder functions  ctl_ms_change_current_folder  Change the working folder	ctl_ms_write_block	Write a fixed-size block to a file			
ctl_ms_change_current_folder Change the working folder	ctl_ms_write_string	Write a string to a file			
•	Folder functions				
ctl_ms_create_folder Create a folder	ctl_ms_change_current_folder	Change the working folder			
	ctl_ms_create_folder	Create a folder			

ctl_ms_get_file_length	Get the length of a file
ctl_ms_remove_folder	Remove a folder
ctl_ms_rename_file	Rename a file
ctl_ms_set_file_length	Set the length of a file
Volume functions	
ctl_ms_get_volume_label	Get the volume label of a volume
ctl_ms_mount_volume	Mount a super-floppy or the default partition
ctl_ms_mount_volume_at_sector	Mount a volume or partition
ctl_ms_remove_file	Remove a file from a volume
ctl_ms_set_volume_label	Set the volume label of a volume
ctl_ms_unmount_volume	Unmount a volume
ctl_ms_unused_clusters	Calculate the number of unused clusters on a volume
Utility functions	
ctl_ms_decode_access_time	Read file last-access time from directory entry
ctl_ms_decode_attributes	Read attributes from directory entry
ctl_ms_decode_create_time	Read file creation time from directory entry
ctl_ms_decode_file_size	Read file size from directory entry
ctl_ms_decode_modify_time	Read file modification time from directory entry
ctl_ms_dos_to_timeval	Convert DOS time to timeval
ctl_ms_is_folder	
ctl_ms_read_sector	Read a sector direct from media
ctl_ms_timeval_to_dos	Convert timeval to DOS time
SD and MMC functions	
ctl_ms_read_cid	Read the card ID from media
ctl_ms_read_csd	Read the card-specific data from media
ctl_ms_read_scr	Read the SD Configuration Register from media
*** UNASSIGNED GROUP ***	
ctl_ms_sense_total_sectors	Determine total number of sectors a volume holds
Status functions	
ctl_ms_read_dirent	Get information on file or directory
Global functions	
ctl_ms_register_error_decoder	Register mass storage error decoder with runtime
Utility	
ctl_ms_update_working_directory	Change working directory

# CTL\_MS\_DIRENTS\_PER\_SECTOR

## Synopsis

#define CTL\_MS\_DIRENTS\_PER\_SECTOR (CTL\_MS\_SECTOR\_SIZE/CTL\_MS\_DIRENT\_SIZE)

## CTL\_MS\_ERROR\_t

#### **Synopsis**

```
typedef enum {
  CTL_MS_NOT_OPEN_ERROR,
  CTL_MS_NAME_ERROR,
  CTL_MS_READONLY_ERROR,
  CTL_MS_SEEK_ERROR,
 CTL_MS_MODE_ERROR,
  CTL_MS_DISK_FULL_ERROR,

  CTL_MS_UNSUPPORTED_OPERATION,
  CTL_MS_MEDIA_LOCKED,
  CTL_MS_SD_ERROR
} CTL_MS_ERROR_t;
```

#### Description

CTL\_MS\_ERROR\_t defines the errors reported by the Mass Storage Library.

#### CTL MS NO FILESYSTEM ERROR

No file system found on media. This this indicates that when attempting to mount the first file system on an MBR-partitioned disk, the MBR did not contain an active entry for any of the MBR partitions.

#### CTL MS UNSUPPORTED MEDIA ERROR

Media is not supported. This indicates that the volume, although it's a FAT volume, is not supported by the release of the mass storage library. Alternatively, it can be that the low-level media drivers have detected that the physical format of the media and its interface cannot be supported because of incompatibilities at the physical layer.

#### CTL\_MS\_BAD\_VOLUME\_ERROR

Volume is invalid. This indicates that the mass storage library detected an error in the format of the FAT volume when mounting it. This can indicate that the volume is simply not a FAT volume or that there is a more serious issue with the layout of the volume headers. If you can, mount the volume in a PC and check its integrity.

#### CTL MS NOT MOUNTED ERROR

File system is not mounted. This indicates that a file operation was requested on a volume that is not mounted.

#### CTL\_MS\_CONFIGURATION\_ERROR

Library configuration error. This indicates that the library has been compiled incorrectly and the internal checks on data structure layout and sizes has failed. Please check the compilation options you provided that affect the compiler's data layout.

#### CTL MS DELAYED WRITE ERROR

Write error flushing sector cache. This indicates that the delayed write of a dirty sector to the media failed.

#### CTL MS CACHE FULL

Sector cache is full. This indicates that the mass storage library required a sector to be read into the sector cache but all sectors in the sector cache are already locked which precludes reading the requested sector. This can happen if you open may files and simultaneously write to them without ensuring that the sector cache is created with at least one sector cache entry per open file.

#### CTL MS CACHE FULL

Internal mass storage error. This this indicates that the mass storage library detected an error that should not happen. Even though the mass storage library is well-tested, there are internal checks in the library to ensure proper operation. If you receive this error, it could show a real error in the mass storage library, but more likely is an error in user code that has corrupted the data structures maintained by the mass storage library.

#### CTL MS UNSUPPORTED OPERATION

Unsupported operation. This indicates that an operation was requested and is not appropriate, or cannot be honored, given the parameters supplied. For instance, requesting the CID from a volume that is not an SD or MMC card is not appropriate and results in this error.

#### CTL\_MS\_MEDIA\_LOCKED

Media is locked. This this indicates that a volume cannot be ejected by **ctl\_ms\_unmount\_volume** because a client has a sector on the volume locked for read or write.

# CTL\_MS\_SECTOR\_BUFFER\_t

## Synopsis

```
typedef struct {
  unsigned char bytes[];
  unsigned short words[];
  unsigned long longs[];
  CTL_MS_DIRENT_t dirent[];
} CTL_MS_SECTOR_BUFFER_t;
```

# CTL\_MS\_SECTOR\_SIZE

## Synopsis

#define CTL\_MS\_SECTOR\_SIZE 512

any other sector size.

# ctl\_ms\_borrow\_sector\_cache\_memory

### **Synopsis**

```
void *ctl_ms_borrow_sector_cache_memory(int n);
```

### Description

ctl\_ms\_borrow\_sector\_cache\_memory borrows n contiguous sector cache entries and
prevents ctl\_ms\_read\_lock\_sector and ctl\_ms\_write\_lock\_sector from using those buffers.
ctl\_ms\_borrow\_sector\_cache\_memory returns zero if n contiguous entries cannot be found.

You can borrow as much as you like from the sector cache but in doing so you may starve the file system of buffers that it requires to manage files and folders on the mounted volume. If the file system is starved, it will fail gracefully without damaging the volume.

# ctl\_ms\_change\_current\_folder

#### **Synopsis**

```
CTL_STATUS_t ctl_ms_change_current_folder(const char *path);
```

### Description

ctl\_ms\_change\_current\_folder changes the current working folder of the task to path.

#### **Return Value**

ctl\_ms\_change\_current\_folder returns a standard status code.

### **Thread Safety**

**ctl\_ms\_change\_current\_folder** is thread-safe. However, note that the current folder for a volume is shared between *all* threads, so changing the current folder in one thread will affect the current folder of *all* threads.

# ctl\_ms\_close\_file

## Synopsis

CTL\_STATUS\_t ctl\_ms\_close\_file(CTL\_STREAM\_t f);

### Description

ctl\_ms\_close\_file closes the file f. All unwritten data is flushed to the physical media.

ctl\_ms\_close\_file returns a standard status code.

### **Thread Safety**

ctl\_ms\_close\_file is thread-safe.

# ctl\_ms\_create\_file

### **Synopsis**

### Description

ctl\_ms\_create\_file creates a file with name name. The file is created with the attributes attrib.

If the file is created without error, **f** is initialized and can be used for further file operations.

#### **Return Value**

ctl\_ms\_create\_file returns a standard status code.

### **Thread Safety**

this is thread-safe.

# ctl\_ms\_create\_folder

## Synopsis

```
CTL_STATUS_t ctl_ms_create_folder(const char *path);
```

### Description

ctl\_ms\_create\_folder creates the folder with the name pointed to by str.

#### **Return Value**

ctl\_ms\_create\_folder returns a standard status code.

### **Thread Safety**

ctl\_ms\_create\_folder is thread-safe.

# ctl\_ms\_decode\_access\_time

### Synopsis

### Description

**ctl\_ms\_decode\_access\_time** extracts the last-access time of the file or directory from the directory entry pointed to by **dirent** into the **struct timeval** pointed to by **tv**.

# ctl\_ms\_decode\_attributes

## Synopsis

```
unsigned ctl_ms_decode_attributes(const CTL_MS_DIRENT_t *dirent);
```

### Description

ctl\_ms\_decode\_attributes returns the attributes from the directory entry pointed to by dirent.

# ctl\_ms\_decode\_create\_time

## Synopsis

### Description

**ctl\_ms\_decode\_create\_time** extracts the creation time of the file or directory from the directory entry pointed to by **dirent** into the **struct timeval** pointed to by **tv**.

# ctl\_ms\_decode\_file\_size

## Synopsis

```
unsigned long ctl_ms_decode_file_size(const CTL_MS_DIRENT_t *dirent);
```

### Description

ctl\_ms\_decode\_file\_size returns the file size field of the directory entry pointed to by dirent. No file on a FAT file system can be larger than 2GB which fits into an unsigned long.

# ctl\_ms\_decode\_modify\_time

### Synopsis

### Description

**ctl\_ms\_decode\_modify\_time** extracts the last-modification time of the file or directory from the directory entry pointed to by **dirent** into the **struct timeval** pointed to by **tv**.

# ctl\_ms\_dos\_to\_timeval

## Synopsis

## Description

ctl\_ms\_dos\_to\_timeval converts the DOS time used in FAT directory entries into a time pointed to by tp.

# ctl\_ms\_feof

## Synopsis

```
int ctl_ms_feof(CTL_STREAM_t s);
```

### Description

ctl\_ms\_feof indicates whether the file file is positioned at the end of file.

ctl\_ms\_feof returns zero is file is not positioned at the end of file and non-zero (true) if it is.

### **Thread Safety**

ctl\_ms\_feof is thread-safe.

# ctl\_ms\_flush\_file

## Synopsis

CTL\_STATUS\_t ctl\_ms\_flush\_file(CTL\_STREAM\_t s);

### Description

ctl\_ms\_flush\_file flushes all unwritten data of the file s to the media.

#### **Return Value**

ctl\_ms\_flush\_file returns a standard status code.

### **Thread Safety**

ctl\_ms\_flush\_file is thread-safe.

# ctl\_ms\_flush\_sector\_cache

### **Synopsis**

CTL\_STATUS\_t ctl\_ms\_flush\_sector\_cache(void);

### Description

**ctl\_ms\_flush\_sector\_cache** writes all dirty sectors to the storage media. The cache entries remain valid so they are immediately ready for a subsequent read request.

If you wish to invalidate the whole cache so that it is empty, use **ctl\_ms\_purge\_sector\_cache**.

All sectors are written to the media. If there is an error writing to the media for any sector, ctl\_ms\_flush\_sector\_cache returns CTL\_MS\_DELAYED\_WRITE\_ERROR.

#### See Also

ctl\_ms\_purge\_sector\_cache

# ctl\_ms\_fputc

### **Synopsis**

### Description

**ctl\_ms\_fputc** writes the character **ch** to the file **f**. The character is written without any translation which means that the C character, '\n', for instance, is not translated to a CR, LF sequence on output.

#### **Return Value**

ctl\_ms\_fputc returns a standard status code.

### **Thread Safety**

ctl\_ms\_fputc is thread-safe.

# ctl\_ms\_ftell

## Synopsis

CTL\_STATUS\_t ctl\_ms\_ftell(CTL\_STREAM\_t s);

### Description

 $ctl\_ms\_ftell$  returns the current position of the file f.

## **Thread Safety**

ctl\_ms\_ftell is thread-safe.

# ctl\_ms\_get\_attributes

## Synopsis

### Description

**ctl\_ms\_get\_attributes** gets the attributes of the file with name **name** on volume **vol** and writes them to the object **attrib**.

#### **Return Value**

ctl\_ms\_get\_attributes returns a standard status code.

### **Thread Safety**

ctl\_ms\_get\_attributes is thread-safe.

# ctl\_ms\_get\_file\_length

## Synopsis

CTL\_STATUS\_t ctl\_ms\_get\_file\_length(CTL\_STREAM\_t s);

### Description

ctl\_ms\_get\_file\_length gets the length of the open file s and returns it.

# ctl\_ms\_get\_volume\_label

### **Synopsis**

```
CTL_STATUS_t ctl_ms_get_volume_label(const char *vol, char *name);
```

### Description

ctl\_ms\_get\_volume\_label reads the volume label of volume vol to the string pointed to by name. name must be able to hold at least 13 characters.

#### **Return Value**

ctl\_ms\_get\_volume\_label returns a standard status code.

### **Thread Safety**

ctl\_ms\_get\_volume\_label is thread-safe.

# ctl\_ms\_is\_folder

## Description

**ctl\_ms\_is\_folder** inquires whether the path **str** designates a folder.

#### **Return Value**

ctl\_ms\_is\_folder returns an extended status code: negative if there is an error accessing the path, 0 if the path does not designate a folder, and a positive value if the path does designate a folder.

## ctl\_ms\_mount\_volume

#### **Synopsis**

```
CTL_STATUS_t ctl_ms_mount_volume(const char *volume);
```

#### Description

**ctl\_ms\_mount\_volume** mounts the volume **vol** using the FAT block driver **driver**. **vol** must be first initialized using **ctl\_ms\_init\_volume**.

**ctl\_ms\_mount\_volume** first reads boot sector (sector zero) of the volume and tries to determine if the volume is in super-floppy format or has a partition table. If the volume is in super-floppy format, it is mounted directly. If the volume has a partition map, the first valid partition on the drive is mounted.

If you need to mount a particular partition or a partition at a non-standard address, you can use **ctl\_ms\_mount\_volume**.

#### **Return Value**

ctl\_ms\_mount\_volume returns a standard status code.

#### **Thread Safety**

ctl\_ms\_mount\_volume is thread-safe.

## ctl\_ms\_mount\_volume\_at\_sector

#### **Synopsis**

#### Description

**ctl\_ms\_mount\_volume\_at\_sector** mounts the super-floppy volume without a master boot record or an MBR-partitioned volume on a disk. **start\_sector** is the LBA of the first sector of the volume on the media for a super-floppy, or the LBA of the first sector of the partition to mount for a volume with an MBR.

#### **Return Value**

**ctl\_ms\_mount\_volume\_at\_sector** returns a standard status code.

#### **Thread Safety**

ctl\_ms\_mount\_volume\_at\_sector is thread-safe.

## ctl\_ms\_open\_file

### **Synopsis**

#### Description

**ctl\_ms\_open\_file** opens the file name **name** on the volume **vol** for reading or writing according to the parameter **mode**.

#### **Return Value**

ctl\_ms\_open\_file returns a standard status code.

#### **Thread Safety**

ctl\_ms\_open\_file is thread-safe.

## ctl\_ms\_open\_file\_relative

#### **Synopsis**

#### Description

**ctl\_ms\_open\_file\_relative** opens the file name **name** relative to the directory **base** on the volume **vol** for reading or writing according to the parameter **mode**.

The effect of this is to open the file whose path is the concatenation of base, a directory separator, and name.

#### **Return Value**

ctl\_ms\_open\_file\_relative returns a standard status code.

#### **Thread Safety**

ctl\_ms\_open\_file\_relative is thread-safe.

## ctl\_ms\_print\_sector\_cache

### **Synopsis**

```
void ctl_ms_print_sector_cache(CTL_STREAM_t s);
```

#### Description

ctl\_ms\_print\_sector\_cache prints the management data for the sector cache to the stream s.

Note that the sector cache mutex is locked when the sector cache is being printed and, hence, if you direct output to a file stream there is a possibility of deadlock if the file system requests a new sector buffer from the sector cache.

## ctl\_ms\_purge\_sector\_cache

#### **Synopsis**

CTL\_STATUS\_t ctl\_ms\_purge\_sector\_cache(void);

#### Description

**ctl\_ms\_purge\_sector\_cache** writes all dirty sectors to the storage media and then invalidates all cache entries so that nothing remains in the cache. Before ejecting the media you should call **ctl\_ms\_purge\_sector\_cache** to ensure that all cached data is written and the physical storage media is consistent.

If you wish to only ensure that unwritten data is flushed such that the storage media is consistent, but allow the cache to remain valid, use **ctl\_ms\_flush\_sector\_cache**.

If there is an error writing to the media for any sector, **ctl\_ms\_purge\_sector\_cache** returns **CTL\_MS\_DELAYED\_WRITE\_ERROR**.

#### See Also

ctl\_ms\_flush\_sector\_cache

## ctl\_ms\_read\_block

### **Synopsis**

#### Description

ctl\_ms\_read\_block reads bytes from the file s into the memory pointed to by data.

ctl\_ms\_read\_block returns the number of bytes read or a CTL error code if an error occurred whilst reading.

#### **Thread Safety**

ctl\_ms\_read\_block is thread-safe.

## ctl\_ms\_read\_char

### **Synopsis**

CTL\_STATUS\_t ctl\_ms\_read\_char(CTL\_STREAM\_t s);

#### Description

**ctl\_ms\_read\_char** reads one character from the file **f**. Operating-system-specific end-of-line combinations are not translated to the C '\n' character; this must be done by the client.

**ctl\_ms\_read\_char** returns a non-negative character if the character was read without error, otherwise otherwise an error code. Specifically, reading beyond the end of file returns the error **CTL\_MS\_READ\_PAST\_EOF\_ERROR**.

#### **Thread Safety**

ctl\_ms\_read\_char is thread-safe.

## ctl\_ms\_read\_cid

## **Synopsis**

#### Description

ctl\_ms\_read\_cid reads the card ID for the the volume vol. The volume vol must refer to a mounted device that has an SD card or MMC card mounted. If vol is some other type of device, ctl\_ms\_read\_cid returns an error.

## ctl\_ms\_read\_csd

### **Synopsis**

#### Description

**ctl\_ms\_read\_csd** reads the card-specific data for the the volume **vol**. The volume **vol** must refer to a mounted device that has an SD card or MMC card mounted. If **vol** is some other type of device, **ctl\_ms\_read\_csd** returns an error.

# ctl\_ms\_read\_dirent

## Synopsis

```
CTL_STATUS_t ctl_ms_read_dirent(const char *path, CTL_MS_DIRENT_t *dirent);
```

## ctl\_ms\_read\_scr

### **Synopsis**

```
CTL_STATUS_t ctl_ms_read_scr(const char *volume, unsigned char *scr);
```

#### Description

ctl\_ms\_read\_scr reads the SCR from the media in volume vol. The volume vol must refer to a mounted device that has an SD card or MMC card mounted. If vol is some other type of device, ctl\_ms\_read\_scr returns an error.

## ctl\_ms\_read\_sector

### **Synopsis**

#### Description

**ctl\_ms\_read\_sector** reads the sector with LBA **lba** on the volume **volume** into the sector cache and writes a buffer pointer to the sector into **buf**.

## ctl\_ms\_read\_string

### **Synopsis**

#### Description

ctl\_ms\_read\_string reads a string from the file file into the string pointed to by str. The buffer for the string str is n characters long. str is terminated with a null character.

#### **Return Value**

**ctl\_ms\_read\_string** returns a standard status code.

#### **Thread Safety**

ctl\_ms\_read\_string is thread-safe.

# ctl\_ms\_register\_error\_decoder

### **Synopsis**

void ctl\_ms\_register\_error\_decoder(void);

### Description

**ctl\_ms\_register\_error\_decoder** registers an error decoder with the CrossWorks runtime system such that **strerror** will correctly decode errors produced by the mass storage library.

## ctl\_ms\_remove\_file

### **Synopsis**

```
CTL_STATUS_t ctl_ms_remove_file(const char *name);
```

### Description

ctl\_ms\_remove\_file removes the file name from the file system.

#### **Return Value**

ctl\_ms\_remove\_file returns a standard status code.

### **Thread Safety**

ctl\_ms\_remove\_file is thread-safe.

## ctl\_ms\_remove\_folder

## **Synopsis**

```
CTL_STATUS_t ctl_ms_remove_folder(const char *path);
```

### Description

ctl\_ms\_remove\_folder removes the folder with the name pointed to by str.

#### **Return Value**

**ctl\_ms\_remove\_folder** returns a standard status code.

### **Thread Safety**

ctl\_ms\_remove\_folder is thread-safe.

## ctl\_ms\_rename\_file

### **Synopsis**

#### Description

ctl\_ms\_rename\_file renames the file with name old\_name to new\_name. old\_name can be a full path name to a file, but new\_name must only be a file name.

#### **Return Value**

ctl\_ms\_rename\_file returns a standard status code.

#### **Thread Safety**

ctl\_ms\_rename\_file is thread-safe.

## ctl\_ms\_return\_sector\_cache\_memory

### **Synopsis**

#### Description

**ctl\_ms\_return\_sector\_cache\_memory** returns the previously-borrowed sector cache memory **addr** to the cache. **n** is the number of sectors that were borrowed.

## ctl\_ms\_sense\_total\_sectors

#### **Synopsis**

```
CTL_STATUS_t ctl_ms_sense_total_sectors(const char *volume);
```

ctl\_ms\_sense\_total\_sectors senses the total number of sectors that the volume volume can hold. For MMC and SD cards, ctl\_ms\_sense\_total\_sectors reads the appropriate registers from the media and computes the total number of 512-byte sectors.

ctl\_ms\_sense\_total\_sectors will return an error code if the total number of sectors cannot be determined.

## ctl\_ms\_set\_attributes

## **Synopsis**

#### Description

ctl\_ms\_set\_attributes sets the attributes of the file with name name on volume vol to attrib.

#### **Return Value**

**ctl\_ms\_set\_attributes** returns a standard status code.

### **Thread Safety**

ctl\_ms\_set\_attributes is thread-safe.

# ctl\_ms\_set\_file\_length

### **Synopsis**

```
CTL_STATUS_t ctl_ms_set_file_length(CTL_STREAM_t s, unsigned long length);
```

### Description

ctl\_ms\_set\_file\_length sets the length of the open file s to length. You cannot extend the file beyond its written length, but you can truncate it.

## ctl\_ms\_set\_volume\_label

#### **Synopsis**

#### Description

ctl\_ms\_set\_volume\_label sets the volume label of volume vol to name.

#### **Return Value**

ctl\_ms\_set\_volume\_label returns a standard status code.

### **Thread Safety**

ctl\_ms\_set\_volume\_label is thread-safe.

# ctl\_ms\_timeval\_to\_dos

## **Synopsis**

### Description

ctl\_ms\_timeval\_to\_dos converts the time pointed to by tp into 'DOS time' used in FAT directory entries.

## ctl\_ms\_unmount\_volume

#### **Synopsis**

```
CTL_STATUS_t ctl_ms_unmount_volume(const char *volume);
```

**ctl\_ms\_unmount\_volume** unmounts the volume **vol**. Before the volume is unmounted, any dirty sectors in the sector cache are flushed to the media and then cleared.

If any file is open on the volume, **ctl\_ms\_unmount\_volume** will fail with an error.

#### **Return Value**

ctl\_ms\_unmount\_volume returns a standard status code.

#### **Thread Safety**

ctl\_ms\_unmount\_volume is thread-safe.

## ctl\_ms\_unused\_clusters

#### **Synopsis**

```
CTL_STATUS_t ctl_ms_unused_clusters(const char *volume, CTL_MS_CLUSTER_t *unused);
```

#### Description

ctl\_ms\_unused\_clusters computes the number of unused clusters on the volume named volume.

On volumes with large FAT tables, **ctl\_ms\_unused\_clusters** may take a long time as the whole of the FAT is traversed to calculate the unused clusters.

#### **Thread Safety**

**ctl\_ms\_unused\_clusters** is thread-safe. Note that although this function is thread-safe, it will lock out *all* file operations on the volume **vol** while computing the number of free clusters.

# ctl\_ms\_update\_working\_directory

## **Synopsis**

#### Description

**ctl\_ms\_update\_working\_directory** changes the path **path**, which is a directory specification, by processing **dir**, which is a relative directory specification.

# ctl\_ms\_write\_block

## **Synopsis**

#### Description

ctl\_ms\_write\_block writes bytes from the memory pointed to by data to the file s.

ctl\_ms\_write\_block returns the number of bytes written or a CTL error code if an error occurred whilst writing.

#### **Thread Safety**

ctl\_ms\_write\_block is thread-safe.

# ctl\_ms\_write\_string

### **Synopsis**

### Description

ctl\_ms\_write\_string writes the string pointed to by str to the file f.

#### **Return Value**

**ctl\_ms\_write\_string** returns a standard status code.

### **Thread Safety**

ctl\_ms\_write\_string is thread-safe.

# <ctl\_ms\_low\_level.h>

## **API Summary**

Types	
CTL_MS_BLOCK_DRIVER_t	Mass storage low-level block driver
CTL_MS_VOLUME_t	Internal volume structure
Sector cache functions	
ctl_ms_flush_sectors_for_volume	Flush all sector cache entries for a volume
ctl_ms_invalidate_sector_cache_range	Invalidate a range of sectors
ctl_ms_invalidate_sector_cache_single	Invalidate a single sector
ctl_ms_read_lock_sector	Lock a sector into the cache for reading
ctl_ms_unlock_buffer	Unlock a sector buffer
ctl_ms_write_lock_sector	Lock a sector into the cache for writing

## CTL\_MS\_BLOCK\_DRIVER\_t

#### **Synopsis**

```
typedef struct {
   CTL_MS_MEDIA_TYPE_t media;
   CTL_STATUS_t (*read_sectors)(void *, CTL_MS_LBA_t , void *, unsigned);
   CTL_STATUS_t (*write_sectors)(void *, CTL_MS_LBA_t , const void *, unsigned);
   CTL_STATUS_t (*init)(void *);
   CTL_STATUS_t (*fini)(void *);
} CTL_MS_BLOCK_DRIVER_t;
```

#### Description

CTL\_MS\_BLOCK\_DRIVER\_t contains the functions needed to read and write data on a volume.

Member	Description
media	The underlying technology for the media.
read_sectors	The method called to read multiple sectors from the media.
write_sectors	The method called to write multiple sectors to the media.

## CTL\_MS\_VOLUME\_t

#### **Synopsis**

```
typedef struct {

```

#### Description

CTL\_MS\_VOLUME\_t describes the internal state of a volume which the mass storage library uses. It is not publicized by any function and all data inside it, if you wish to examine members, should be considered read-only. We do not guarantee that the structure will be stable across releases of the mass storage library.

Only the members **block\_driver**, **mutex**, and **state** are valid for volumes that are not mounted; all other members should be considered invalid for offline volumes.

Member	Description
block_driver	This is public knowledge and you're responsible for populating it. Methods to read and write a single 512-byte sector.
mutex	Volume mutex; this is a per-volume mutex that is locked when the volume is accessed by the mass storage library.
state	The internal state of the volume. A volume can be in offline, online, and mounted states.

sectors_per_cluster	The number of 512-byte sectors per FAT cluster.
reserved_sector_count	The number of sectors that are marked as reserved at the start of the media.
root_entry_count	The number of directory entries in the root directory for FAT12 and FAT16 volumes.
number_of_fats	The number of FATs contained on the volume. This is either one or two.
fat_type	The type of FAT volume, either FAT12, FAT16, or FAT32.
second_fat_offset	The LBA offset from the start of the volume for the second FAT.
partition_addr	The LBA of the first sector of the volume on the media.
root_dir_sector	The LBA of the first sector of the volume's root directory.
current_dir_sector	The LBA of the internal current working directory. This does not correspond to the 'current directory' that operating systems such as MS-DOS, Windows, and Unix have. This is purely an internal convenience for the implementation of the mass storage library.
working_dir_sector	The LBA of the internal working directory. This is purely an internal convenience for the implementation of the mass storage library.
fat1_sector	The LBA of the first sector of the first FAT.
fat2_sector	The LBA of the first sector of the second FAT; if there is no second FAT, this member is undefined.
first_data_sector	The LBA of the first data sector relative to the start of the volume. The first data sector follows the reserved sectors, FATs, and root directory entries.
total_data_clusters	The number of data clusters for the volume.
free_cluster	The index of the first potentially-free cluster on the volume. The first two clusters of a FAT volume are reserved. This member is maintained internally by the mass storage library to accelerate finding free clusters in the FAT.
root_cluster	The cluster index of the root directory for FAT32 volumes. This member is undefined for FAT12 and FAT16 volumes.
fsinfo_sector	The LBA of the FSInfo sector relative to the start of the volume. This member is undefined for FAT12 and FAT16 volumes.

error	The last reported error for the volume. This is maintained internally by the mass storage library and has no relevance for any client.
temp_name	A temporary working name store for the mass storage library. This is maintained internally by the mass storage library and has no relevance for any client.
open_files	A linked list of files that are open on the volume.

# ctl\_ms\_flush\_sectors\_for\_volume

### **Synopsis**

CTL\_STATUS\_t ctl\_ms\_flush\_sectors\_for\_volume(CTL\_MS\_VOLUME\_t \*vol);

#### Description

**ctl\_ms\_flush\_sectors\_for\_volume** flushes all sectors in the cache associated with the volume **vol** to the media. If a sector on the volume is locked for read or write, **ctl\_ms\_flush\_sectors\_for\_volume** fails immediately, without writing any sector to the media, and the sector cache is unmodified.

## ctl\_ms\_invalidate\_sector\_cache\_range

#### **Synopsis**

#### Description

**ctl\_ms\_invalidate\_sector\_cache\_range** invalidates the sectors **first** to **last** inclusive on volume **vol**. If the sectors are marked dirty, they are *not* written to the media.

You can use **ctl\_ms\_invalidate\_sector\_cache\_range** function to notify the sector cache of changes that happen outside of its control. An example of this is if you write or modify the media directly using device driver functions without going through the sector cache functions **ctl\_ms\_read\_lock\_sector** or **ctl\_ms\_write\_lock\_sector**—because the media is written without the sector cache being aware of the changes you must invalidate all the sectors in the cache that you have changed or the media will become inconsistent and you may lose data on the volume.

## ctl\_ms\_invalidate\_sector\_cache\_single

#### **Synopsis**

#### Description

**ctl\_ms\_invalidate\_sector\_cache\_single** invalidates a single sector **first** on volume **vol**. If the sectors is marked dirty, it is *not* written to the media.

#### See Also

 $ctl\_ms\_invalidate\_sector\_cache\_range.$ 

## ctl\_ms\_read\_lock\_sector

#### **Synopsis**

```
CTL_MS_SECTOR_BUFFER_t *ctl_ms_read_lock_sector(CTL_MS_VOLUME_t *vol, CTL_MS_LBA_t sector);
```

### Description

ctl\_ms\_read\_lock\_sector reads sector sector from volume vol into the sector cache if not already present.
Sectors will be flushed to the media as necessary in order to make space in the cache for the requested sector.
ctl\_ms\_read\_lock\_sector will return zero if there is an error reading the sector from the volume or if there was an error flushing a sector in order to make room for this one.

#### See Also

ctl\_ms\_unlock\_buffer.

## ctl\_ms\_unlock\_buffer

#### **Synopsis**

CTL\_STATUS\_t ctl\_ms\_unlock\_buffer(CTL\_MS\_SECTOR\_BUFFER\_t \*buf);

#### Description

**ctl\_ms\_unlock\_buffer** releases the sector buffer **buf** so that it can be flushed from the cache. Note that the buffer, if marked as dirty, is not immediately flushed to the media: you must call **ctl\_ms\_flush\_sector\_cache** in order to ensure that the contents of the media and the match the sector cache.

## ctl\_ms\_write\_lock\_sector

#### **Synopsis**

```
CTL_MS_SECTOR_BUFFER_t *ctl_ms_write_lock_sector(CTL_MS_VOLUME_t *vol, CTL_MS_LBA_t sector);
```

#### Description

ctl\_ms\_write\_lock\_sector reads sector sector from volume vol into the sector cache if not already present.
Sectors will be flushed to the media as necessary in order to make space in the cache for the requested sector. The sector buffer associated with the sector will be marked dirty so that it will be flushed by
ctl\_ms\_flush\_sector\_cache or when space is needed in the sector cache. ctl\_ms\_write\_lock\_sector will return zero if there is an error reading the sector from the volume.

# <ctl\_ms\_private.h>

## **API Summary**

*** UNASSIGNED GROUP ***	
CTL_MS_INVALID_CLUSTER	This is a private API for the core library. Please don't use this
ctl_ms_erase_cluster_chain	Erase a cluster chain and return it to the free list.
ctl_ms_start_enumeration	Start directory contents enumeration.
Private functions	
ctl_ms_check_volume_state	Checks the state of a volume
ctl_ms_cluster_to_sector	Converts a cluster number to a sector address
ctl_ms_find_fcb	Get file control block for stream
ctl_ms_lock_volume	Locks a volume for exclusive access
ctl_ms_read_fat_entry	Reads a cluster entry from the FAT
ctl_ms_sector_to_cluster	Converts a sector address to a cluster number
ctl_ms_unlock_volume	Unlocks a previously-locked volume

# CTL\_MS\_INVALID\_CLUSTER

because you'll only come to grief.

# ctl\_ms\_check\_volume\_state

### Synopsis

```
CTL_STATUS_t ctl_ms_check_volume_state(CTL_MS_VOLUME_t *vol);
```

ctl\_ms\_check\_volume\_state checks to see whether vol has been properly mounted. If the volume is properly mounted, ctl\_ms\_check\_volume\_state returns CTL\_NO\_ERROR otherwise CTL\_MS\_NOT\_MOUNTED\_ERROR.

# ctl\_ms\_cluster\_to\_sector

### Synopsis

```
CTL_MS_LBA_t ctl_ms_cluster_to_sector(const CTL_MS_VOLUME_t *vol, CTL_MS_CLUSTER_t n);
```

#### Description

ctl\_ms\_cluster\_to\_sector converts the cluster number n on volume vol to a sector address on the same volume.

#### See Also

ctl\_ms\_cluster\_to\_sector

# ctl\_ms\_erase\_cluster\_chain

### Synopsis

```
CTL_STATUS_t ctl_ms_erase_cluster_chain(CTL_MS_VOLUME_t *vol, CTL_MS_CLUSTER_t start_cluster);
```

### Description

ctl\_ms\_erase\_cluster\_chain returns the cluster chain starting at start\_cluster to the set of free clusters.

# ctl\_ms\_find\_fcb

### Synopsis

CTL\_MS\_FCB\_t \*ctl\_ms\_find\_fcb(CTL\_STREAM\_t s);

## ctl\_ms\_lock\_volume

### Synopsis

```
void ctl_ms_lock_volume(CTL_MS_VOLUME_t *vol);
```

#### Description

**ctl\_ms\_lock\_volume** locks the volume **vol** for exclusive access. The mutex associated with the volume is claimed and, as such, each call to **ctl\_ms\_lock\_volume** to lock the volume must be paired with a call to **ctl\_ms\_unlock\_volume**.

#### See Also

ctl\_ms\_unlock\_volume

# ctl\_ms\_read\_fat\_entry

### Synopsis

### Description

ctl\_ms\_read\_fat\_entry reads the FAT to find the next cluster after the cluster cluster in the linked list of clusters (the 'cluster' chain).

## ctl\_ms\_sector\_to\_cluster

### Synopsis

```
CTL_MS_CLUSTER_t ctl_ms_sector_to_cluster(const CTL_MS_VOLUME_t *vol, CTL_MS_LBA_t addr);
```

#### Description

**ctl\_ms\_sector\_to\_cluster** converts the sector address **addr** on volume **vol** to a cluster number on the same volume.

#### See Also

ctl\_ms\_sector\_to\_cluster

## ctl\_ms\_start\_enumeration

#### **Synopsis**

#### Description

**ctl\_ms\_start\_enumeration** searches the volume **vol** in the folder starting at sector **sector** for entries that match **filename** and **attrib**.

You must provide a pointer to a directory entry structure, **dir**, to hold contextual information when enumerating the directory.

# ctl\_ms\_unlock\_volume

### Synopsis

CTL\_STATUS\_t ctl\_ms\_unlock\_volume(CTL\_MS\_VOLUME\_t \*vol);

### Description

**ctl\_ms\_unlock\_volume** unlocks the previously-locked volume **vol**. Each call to **ctl\_ms\_unlock\_volume** must be paired with a call to **ctl\_ms\_lock\_volume**.

#### See Also

ctl\_ms\_lock\_volume

# <ctl\_ms\_sd.h>

# **API Summary**

SPI Device Drivers	
ctl_ms_sd_spi_read_sectors	Read sectors from a media card in SPI mode
ctl_ms_sd_spi_write_sectors	Write sectors from a media card in SPI mode
SPI	
ctl_ms_sd_spi_read_cid	Reads the CID register from a media card in SPI mode
ctl_ms_sd_spi_read_csd	Reads the CSD register from a media card in SPI mode
ctl_ms_sd_spi_read_scr	Reads the SCR register from a media card in SPI mode
ctl_ms_sd_spi_sense_media	Sense the media type (SD or MMC) attached to the drive

# ctl\_ms\_sd\_spi\_read\_cid

#### **Synopsis**

```
CTL_STATUS_t ctl_ms_sd_spi_read_cid(CTL_MS_SD_DRIVER_t *driver, unsigned char *cid);
```

#### Description

ctl\_ms\_sd\_spi\_read\_cid reads the card ID (CID) register from the media card into cid using the device driver driver. cid must point to a buffer that is at least 16 characters in size.

### **Thread Safety**

ctl\_ms\_sd\_spi\_read\_cid is thread-safe.

# ctl\_ms\_sd\_spi\_read\_csd

#### **Synopsis**

#### Description

**ctl\_ms\_sd\_spi\_read\_csd** reads the card-specific data (CSD) register from the media card into **csd** using the device driver **driver. csd** must point to a buffer that is at least 16 bytes in size.

### **Thread Safety**

ctl\_ms\_sd\_spi\_read\_csd is thread-safe.

# ctl\_ms\_sd\_spi\_read\_scr

### Synopsis

```
CTL_STATUS_t ctl_ms_sd_spi_read_scr(CTL_MS_SD_DRIVER_t *driver, unsigned char *scr);
```

#### Description

ctl\_ms\_sd\_spi\_read\_scr reads the system control register (SCR) from the media card into scr using the device driver driver. scr must point to a buffer that is at least 8 bytes in size.

### **Thread Safety**

ctl\_ms\_sd\_spi\_read\_scr is thread-safe.

# ctl\_ms\_sd\_spi\_read\_sectors

### Synopsis

```
CTL_STATUS_t ctl_ms_sd_spi_read_sectors(void *driver,

CTL_MS_LBA_t addr,

void *buf,

unsigned count);
```

### Description

**ctl\_ms\_sd\_spi\_read\_sectors** reads **count** sectors at sector address **addr** into memory at **buf** using the SPI driver **driver**.

#### **Thread Safety**

ctl\_ms\_sd\_spi\_read\_sectors is thread-safe.

# ctl\_ms\_sd\_spi\_sense\_media

## Synopsis

# ctl\_ms\_sd\_spi\_write\_sectors

### **Synopsis**

```
CTL_STATUS_t ctl_ms_sd_spi_write_sectors(void *driver,

CTL_MS_LBA_t addr,

const void *buf,

unsigned count);
```

#### Description

ctl\_ms\_sd\_spi\_write\_sectors reads count sectors at sector address addr into memory at buf using the SPI driver

#### **Thread Safety**

ctl\_ms\_sd\_spi\_write\_sectors is thread-safe.
